Abstract—Method and system for human action detections with acceleration sensors for the proposed rescue system for disabled and elderly persons who need a help in evacuation from disaster areas is proposed. Not only vital signs, blood pressure, heart beat pulse rate, body temperature, bless and consciousness, but also, the location and attitude of the persons have to be monitored for the proposed rescue system. The attitude can be measured with acceleration sensors. In particular, it is better to discriminate the attitudes, sitting, standing up, and lying down. Also, action speed has to be detected. Experimental results show that these attitude monitoring can be done with acceleration sensors.

Keywords—vital sign; heart beat pulse rate; body temperature; blood pressure; blesses, consciousness; seensor network

I. INTRODUCTION

Handicapped, disabled, diseased, elderly persons as well as peoples who need help in their ordinary life are facing too dangerous situation in event of evacuation when disaster occurs. In order to mitigate victims, evacuation system has to be created. Authors proposed such evacuation system as a prototype system already [1]-[4].

The system needs information of victims’ locations, physical and psychological status as well as their attitudes. Authors proposed sensor network system which consist GPS receiver, attitude sensor, physical health monitoring sensors which allows wearable body temperature, heart beat pulse rates; bless monitoring together with blood pressure monitoring [5]-[7]. Also the number of steps, calorie consumptions is available to monitor. Because it is difficult to monitor the blood pressure with wearable sensors, it is done by using the number of steps and body temperature. In addition to these, psychological status is highly required for vital sign monitoring (consciousness monitoring). By using EEG sensors, it is possible to monitor psychological status in the wearable sensor. These are components of the proposed physical health and psychological monitoring system.

Method and system for human action detections with acceleration sensors for the proposed rescue system for disabled and elderly persons who need a help in evacuation from disaster area is proposed. Experimental results show that human actions can be estimated with acceleration sensors.

Section 2 describes the proposed acceleration sensor system followed by experiment method and results. Then conclusion is described together with some discussions.

II. PROPOSED SENSOR NETWORK SYSTEM

A. Acceleration Sensor Used

Figure 1 shows outlook of the acceleration sensor used in the proposed rescue system. It is the Small Sized Wireless Hybrid Sensor WAA-010

![Fig. 1. Outlook of the Small Sized Wireless Hybrid Sensor WAA-010.](image)

It allows measurements of movements in x, y, and z directions and roll, pitch and yaw rotations. WAA-010 is a multi sensor which allows measurements of attitude, angular velocity (gyro), Earth magnet in three axes. Also WAA-010 has communication capability to PC through Bluetooth communication links.

B. Acceleration Data Acquisition

Figure 2 (a) shows the toggle of the Bluetooth while Figure 2 (b) shows installation window of Bluetooth on PC display.
After the installation of acceleration sensor driver, communication port assignments, batteries of the three-axis accelerometer, angular velocity as well as Earth magnet-meter can be monitored through PC screen which is shown in Figure 3.

### III. EXPERIMENTS

#### A. Examples of Acceleration and Angular Velocity Data

Figure 4 (a) shows an example of acceleration sensor data with the maximum range of 5000mG while Figure 4 (b) shows an example of measured acceleration sensor data with the maximum range of 2000mG. As shown in Figure 4, the maximum range has to be adjusted for the acceleration of the target objects. Meanwhile, Figure 5 (a) and (b) shows an example of measured angular velocity with maximum of 500 dps and 200 dps, respectively. These examples are obtained through the experiments of which the acceleration sensor are held by hands. Therefore, these performances are just for the acceleration sensor only.
Fig. 4. Examples of acceleration sensor data

Fig. 5. Examples of angular velocity measured

Meanwhile, example of acceleration sensor data (200mG of maximum range) for the motion in Z direction is shown in Figure 6 (a).

On the other hand, Figure 6 (b) and (c) shows examples of acceleration sensor data for the motion in Y and X directions, respectively.

Figure 7 (a), (b), and (c) shows examples of angular velocity data (500 dps of maximum range) for the rotations in Z, Y, X directions, roll, pitch and yaw angles, respectively.
B. Examples of Acceleration and Angular Velocity Data Attached to the Wearing Glass End

Acceleration sensor is then attached to the wearing glass end as is shown in Figure 8. Not only the acceleration sensor but also body temperature, heart beat pulse rate sensors as well as EEG sensor head are attached to the glass end together with battery and Bluetooth communicator. At the forehead, EEG sensor head is attached with spring wire extended from the center of the glass. Therefore most of vital signs can be measured with the glass.

Figure 9 shows examples of acceleration sensor and angular velocity data when the user lie down and stand up slowly. Meanwhile, Figure 10 shows examples of those when the user sit down on a chair slowly.

Figure 11 shows examples of acceleration sensor and angular velocity data when the user lie down and stand up quickly. Meanwhile, Figure 12 shows examples of those when the user sit down on a chair quickly. On the other hand, Figure 13 (a) shows Y axis data when the user lies down and stand up quickly.
slowly while Figure 13 (b) shows X axis data when the user sit down on the chair slowly.

Furthermore, Figure 13 (c) shows Y axis data when the user lies down and stand up quickly while Figure 13 (d) shows X axis data when the user sit on the chair quickly.

Fig. 11. Examples of acceleration sensor and angular velocity data when the user lie down and stand up quickly.

Fig. 12. Examples of acceleration sensor and angular velocity data when the user sit down on chair quickly.

Fig. 13. Specific axis data for the action of lie down and then stand up as well as sit down on the chair, slowly and quickly.
C. Validation of Acceleration and Angular Velocity Data

Three axes of acceleration sensor and angular velocity sensor data are validated for the actions “Lie down and then stand up slowly”, “Sit down on the chair slowly”, “Lie down and then stand up quickly”, “Sit down on the chair quickly”. The results are shown in Figure 14. Through these validations, it is found that the most effective signal for detection of lie down and then stand up is acceleration in Y axis while that for detecting of sit down action is angular velocity sensor data in Z axis as are shown in Table 1.

IV. CONCLUSION

Method and system for human action detections with acceleration sensors for the proposed rescue system for disabled and elderly persons who need a help in evacuation from disaster areas is proposed. Not only vital signs, blood pressure, heart beat pulse rate, body temperature, bess and consciousness, but also, the location and attitude of the persons have to be monitored for the proposed rescue system. The attitude can be measured with acceleration sensors.

In particular, it is better to discriminate the attitudes, sitting, standing up, and lying down. Also, action speed has to be detected. Experimental results show that these attitude monitoring can be done with acceleration sensors.

Through these validations, it is found that the most effective signal for detection of lie down and then stand up is acceleration in Y axis while that for detecting of sit down action is angular velocity sensor data in Z axis. Namely, validation results for detection of users’ actions of “Lie down and then stand up” and “Sit down on the chair”

ACKNOWLEDGMENT

The author would like to thank all the patients who are contributed to the experiments conducted. The author also would like to thank Professor Dr. Takao Hotokebuchi, President of Saga University for his support this research works.
