Abstract—This paper provides a survey of the existing literature and research carried out in the area of project management using different models, methodologies, and frameworks. Project Management (PM) broadly means programme management, portfolio management, practice management, project management office, etc. A project management system has a set of processes, procedures, framework, methods, tools, methodologies, techniques, resources, etc. which are used to manage the full life cycle of projects. This also means to create risk, quality, performance, and other management plans to monitor and manage the projects efficiently and effectively.

Keywords—Programme/ Program Management, Project Management, Maturity Models, Onshore-offshore Management, Leadership and Management, Global Distributed Projects

I. INTRODUCTION

Projects are considered at all levels of organisation which may involve one or many business units and they can involve one or 100s of persons. The duration of projects can vary from a few weeks to many years. Projects can be simple to highly complex projects, which may be implemented at one location or multiple locations across multiple countries.

There are two main PM standards i.e. Project Management Body of Knowledge (PMBOK) by PMI, USA and PRINCE-2 by APMG, UK.

Considering the PMBOK and PRINCE-2 standard as the base, models may be defined for the process and knowledge management areas of PM. The benefits of having models includes support for defining tools for project management, deliverables and documentation, and to improve consistency between different areas and processes of PMBOK. It may be able to benefit other projects as the tools, documents and deliverables can be reused. The use of modelling will also bring consistency and reliability in the management of various projects. This will make project monitoring and controlling easier during the execution and whole life cycle of the project.

The final advantage will come in the form of delivering good quality projects on time, budget and scope with improved quality. This will lead to overall customer satisfaction as risk and issues have been managed efficiently and effectively.

According to an independent study, undertaken and conducted by Loudhouse Research, on behalf of CA in 2007 on the “The changing face of project management” studying the Project panorama in UK corporates and observing the project failure as well as excellence. Study redefines the failure, emphasising the strategic value the projects deliver rather than exclusively on delivery within budget and time.

• 26% of surveyed companies are spending more than half of IT budget on IT projects
• Average company is managing 29 projects at once and 1 in 10 companies is managing more than 100 projects at a time
• More than half of IT Directors (52%) think projects are more complex than 5 years ago, fuelled by increased demand from business (62%) and a more pressurised regulatory environment (55%)
• For 59%, less than half of initiatives are strategic.
• 53% projects are based on business processes improvement,
• 36% on growing revenues
• 32% on bringing new products/ services

Survey also covered various issues in managing projects effectively. Some of these are as follows:

• Typical budget over-runs 30%; 1 in 6 projects going more than 50% over budget; 10 out of 29 projects on the go at one time will come in over budget
• Inaccurate scoping and forecasting is blamed for budget over-runs in half of cases (50%). With scope creep responsible in 4 out of 10 cases.
• Only a 3rd (35%) of businesses check that initiatives are aligned with business objectives with only 1 in 8 companies basing this decision on real time, accurate information.
• 74% struggle to access critical skills
• 39% of IT Directors don’t have complete visibility over all IT initiatives in progress
• 42% of IT directors know within a day if an initiative is off-course

Therefore a standard methodology is required to deliver the projects efficiently and effectively within time and budget.
There are two main standards for project management i.e. Project Management Body of Knowledge (PMBOK) by PMI, USA and PRINCE2 by APMG, UK. PMBOK is more dominant standard as this is used in more than 75% of the projects around the world.

Software/IT projects use various methodologies such as SSADM, RUP, Spiral Model, Scrum, Extreme Programming, etc. and management methodologies such as PMBOK, PRINCE2.

According to Project Management Body of Knowledge (PMBOK) [1], a project is a temporary endeavour undertaken to create a unique product, service or result. According to PMBOK project management is realised through the combination and practice of five project management processes: Initiating, Planning, Executing, Monitoring and Controlling, and Closing. PMBOK divides project management into ten knowledge areas of Integration, Scope, Time, Cost, Quality, Human Resource, Communication, Risk, Procurement, and Stakeholder Management. Project management is the effective use of processes, procedures, tools, techniques along with knowledge, and skills to meet project objectives. Project managers have to manage the traditional Triple constraints – “Scope, Time, and Cost”, which have been enhanced in recent time with three more constraints called “Quality, Risk and Customer Satisfaction”.

PRINCE2 [2] describes a project as “A management environment that is created for the purpose of delivering one or more business products according to specified business needs”. The PRINCE2 process model comprises of eight distinctive management processes namely Starting up a Project (SU), Directing a Project (DP), Initiating A Project (IP), Planning (PL), Managing Stage Boundaries (SB), Controlling a Stage (CS), Managing Product Delivery (MP), Closing a Project (CP) which covers the full life cycle of a project. PRINCE2 is a de facto standard used extensively in UK government.

A key standard amongst maturity models for Portfolio, Programme, and Project Management is P3M3 [3]. This offers a framework for organizations with which they can assess their current performance and develop/implement improvement plans with measurable outcomes based on industry best practice

### II. PROJECT MANAGEMENT BODY OF KNOWLEDGE (PMBOK)

PMI (USA) developed a Project Management Body of Knowledge (PMBOK) [1], which can be described as collection of project management knowledge. Similar to other professions like engineering, medicine, accounting etc., this body of knowledge rests with professionals in the project management field who uses this knowledge and also propose advancements in it. PMBOK provides good practices, knowledge, tools, skills, and techniques for better, efficient and effective project management. It does not mean that all the things described can be applied to all projects, but has to be modelled and tailored depending on the various constraints of the project like size, budget, time, location etc. PMBOK also describes the common terminology and language for project documentation, reports, writing etc. This makes it easier for all to understand and work on the project by reducing the communication gap.

According to PMBOK [1], differences among project, program and portfolio management is as follows in Table 1.1:

<table>
<thead>
<tr>
<th></th>
<th>PROJECTS</th>
<th>PROGRAMS</th>
<th>PORTFOLIOS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scope</td>
<td>Projects have defined objectives. Scope is progressively elaborated throughout the project life cycle.</td>
<td>Programs have a larger scope and provide more significant benefits.</td>
<td>Portfolios have a business scope that changes with the strategic goals of the organization.</td>
</tr>
<tr>
<td>Change</td>
<td>Project managers expect change and implement processes to keep change managed and controlled.</td>
<td>The program manager must expect change from both inside and outside the program and be prepared to manage it.</td>
<td>Portfolio managers continually monitor changes in the broad environment.</td>
</tr>
<tr>
<td>Planning</td>
<td>Project managers progressively elaborate high-level information into detailed plans throughout the project life cycle.</td>
<td>Program managers develop the overall program plan and create high-level plans to guide detailed planning at the component level.</td>
<td>Portfolio managers create and maintain necessary processes and communication relative to the aggregate portfolio.</td>
</tr>
<tr>
<td>Management</td>
<td>Project managers manage the project team to meet the project objectives.</td>
<td>Program managers manage the program staff and the project managers; they provide vision and overall leadership.</td>
<td>Portfolio managers may manage or coordinate portfolio management staff.</td>
</tr>
<tr>
<td>Success</td>
<td>Success is measured by product and project quality, timeliness, budget compliance, and degree of customer satisfaction.</td>
<td>Success is measured by the degree to which the program satisfies the needs and benefits for which it was undertaken.</td>
<td>Success is measured in terms of aggregate performance of portfolio components.</td>
</tr>
<tr>
<td>Monitoring</td>
<td>Project managers monitor and control the work of producing the products, services or results that the project was undertaken to produce.</td>
<td>Program managers monitor the progress of program components to ensure the overall goals, schedules, budget, and benefits of the program will be met.</td>
<td>Portfolio managers monitor aggregate performance and value indicators.</td>
</tr>
</tbody>
</table>
PMBOK [1] defines a project as follows:

- A temporary endeavour to create a unique product, service or a result.
- Creates a unique product, service or result.
- Is progressively elaborated – distinguishing characteristics of each unique project will be progressively detailed as the project is better understood.

According to PMBOK [1]:

- Temporary means that every project has a definite beginning and a definite end. Projects are not on-going efforts.
- Unique Product means a product or an artifact that is produced, is quantifiable, and can be either an end item in itself or component item.
- A capability to perform a service, such as business functions supporting production or distribution.
- A result such as outcomes or documents e.g. research project.

Progressive Elaboration is a characteristic of projects that accompanies the concepts of temporary and unique. This means developing in steps and continuing by increments. Progressive elaboration is not scope creep.

Management by objectives (MBO) has three steps:

- Establish unambiguous and realistic objectives.
- Periodically evaluate if objectives are being met.
- Implement corrective action.

Project managers have to manage the traditional triple constraints of Cost, Time, and Scope. The new demands in the project management emphasises three more constraints of Quality, Risk, and Customer Satisfaction which the project manager should manage. Prioritisation of the constraints may be managed by the management directly or indirectly.

The stakeholder in the project is someone whose interests and whose influence may be positively or negatively impacted by the project. Negative stakeholders are often overlooked by the project team at the risk of failing to bring their project to successful end. The key stakeholders in the project are project manager, customer, performing organisation, users, project team, sponsor, and project management office (PMO). All of the stakeholders must be identified, documenting their requirements, communicating and managing their expectations and influences on the project. Project management team has professional responsibility towards all of its stakeholders and public in general. PMI members must adhere to the “Code of Ethics” and Project Management Professionals (PMP)’ certification should adhere to a “Code of Professional Conduct”.

Projects are approved depending on the strategic objectives of the organisation such as Market demand, organisational need, customer request, technology advance, legal requirement, etc.

Project management system is described as a set of tools, techniques, methodologies, resources and procedures. PMI divides project management into professional and social responsibility knowledge areas and process groups. The PMBOK describes the integration among project management processes, the relations among them and function they serve.

PMBOK combines these processes into five process groups which are defined as Project Management Process Groups which are Initiating Process Group, Planning Process Group, Executing Process Group, Monitoring and Controlling Process Group, and Closing Process Group.

Even though the project management processes are presented as discrete elements, but they overlap and project management professionals can manage the project in different ways. The objectives of the projects can be defined based on the complexity, risk, size, time, resources, documents, deliverables, application area, geographic spread, experience, and maturity of team and organisation. The concept of interaction and overlapping of PM processes can be traced to Plan-Do-Check-Act (PDCA) cycle.

The Planning Process Group corresponds to “Plan” component of PDCA, the Executing Process Group corresponds to “Do” component of PDCA, the Monitoring and Controlling Process Group corresponds to “Check and Act” component of PDCA as shown in the Figure 1 below:

![PDCA cycle](image)

Fig. 1. Project Management Processes mapped to the PDCA Cycle (Plan-Do-Check-Act)

PMI further divides the project management into ten Knowledge Areas which are Project Integration Management, Project Scope Management, Project Time Management, Project Cost Management, Project Quality Management, Project Human Resources Management, Project Communications Management, Project Risk Management, Project Procurement Management, and Project Stakeholder Management.

**Project Integration Management:** It describes the processes and activities which integrate various components of the project.

**Project Scope Management:** This describes the processes which are used to calculate the scope, and only the work required, for successful completion of the project.
Project Time Management: defines the processes for completing the project on time.

Project Cost Management: describes process for estimating, planning, budgeting and controlling the cost of the project.

Project Quality Management: defines the processes for assuring that the project is delivered as per the required standard and objectives.

Project Human Resource Management: defines the processes for managing the human resources for the project.

Project Communication Management: describes the processes for collecting, processing, sending and receiving the information to the appropriate channels.

Project Risk Management: describes the processes for managing, prioritising, and mitigating risk for the project.

Project Procurement Management: describes the processes for contract management for purchasing any services, results or products.

Project Stakeholder Management: discusses the processes for managing stakeholders and understanding their expectations and managing them effectively.

III. PRINCE-2

PRINCE (PRojects IN Controlled Environments) [2] is a structured method for effective project management. The method was developed first in 1989 by CCTA (The Central Computer and Telecommunication Agency). The method was adopted from PROMPTII, a project management method developed by Simpact Systems Ltd in 1975. Office of Government (earlier CCTA) further enhanced the method continuously and PRINCE-2 was launched in 1996. PRINCE-2 is based on the information and experiences shared by various experts, professionals in project management field.

PRINCE-2 is a de-facto standard used extensively by UK government. This is also used widely in private sector, but more in UK than internationally.

PRINCE-2 defines a project as, “A management environment that is created for the purpose of delivering one or more business products according to a specified business case”. Another definition of project according to PRINCE-2 is, “A temporary organisation that is needed to produce a unique and predefined outcome or result at a pre-specified time using predetermined resources”.

According to Prince-2, project has the following characteristics:

- A finite and defined life cycle.
- Defined and measurable business products.
- A corresponding set of activities to achieve the business products.
- A defined amount of resources.
- An organisation structure, with defined responsibilities, to manage the project.

The PRINCE-2 process model is shown in the Figure 2.

This model consists of eight distinctive management processes for the full life cycle of the project. The Planning process is used by four of the other processes.

IV. PRINCE-2 STRENGTHS

- Organization (Project Boards; defined roles and responsibilities; ownership & accountability)
- Business case-based; on-going assessment of project viability by project owners (Board)
- Product-Based Planning (strictly deliverable oriented); Product Flow; Product Descriptions
- Integrated process structure; clear statement of how to manage the project (“How do I get started? What do I do first?”)
- Clear quality management points (esp. Quality Control), and Quality Assurance roles and responsibilities
- Defined and orderly handling of Work Packages (Managing Product Delivery)

V. PMBOK AND PRINCE-2 COMPARISON

Basic contrast between PMBOK and PRINCE-2 is as follows in Table-2:
PRINCE2 is built on seven elements, or Themes: Business Case, Organization, Plans, Progress, Risk, Quality, and Change (comprising configuration management and change control). They roughly map against the nine PMBOK Knowledge areas as follows in Table-3:

### TABLE.III. KNOWLEDGE AREAS PMBOK VS PRINCE-2

<table>
<thead>
<tr>
<th>PMBOK Knowledge areas</th>
<th>PRINCE-2 components/ Themes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integration</td>
<td>Combined Processes and Components/ Themes, Change Control</td>
</tr>
<tr>

VI. LITERATURE SURVEY

Previous research had been focusing on different aspects of the program and project management such as study of models and framework, empirical, and statistical studies. The studies had been conducted in different industry sectors but most of the research has been in the software and IT industry as given below in Table-5.

### TABLE.V. LITERATURE SURVEY

<table>
<thead>
<tr>
<th>Ref. No.</th>

<tr>
<td>4.</td>
<td>Project Management Models/ frameworks</td>
<td>This paper discussed and compared project management / frameworks for managing software projects. Authors compared five different methodologies with PMBOK. This research can be of useful help for projects managers to decide on particular methodology for different projects.</td>
<td>This research suggests that project manager must have skills and knowledge of various methodologies used for successful completion of projects. The research highlighted that organisation adhere to one methodology due to cost involved, risks associated with other, and training required for its staff. The paper proposed a generic approach to project management.</td>
</tr>
<tr>
<td>5.</td>
<td>Project Management Models/ frameworks</td>
<td>This research paper discussed three concepts for project approach. The first step is to develop global project framework for defining objectives, project life cycle and possible steps for projects repeatability. The 2nd step is to analyse and build project specifications, plans using transition graphs, and performance measurement baselines. Final step is to describe organisation design, roles, job specifications, deliverables and timelines, etc. for project manager and teams.</td>
<td>The paper proposed to follow one specific model but at the same time suggests changing the model dynamically with the project needs using modular and flexible approach. The results showed that projects can be managed in a better manner with clear deliverables and milestones using three step approach. The dynamic change in the deliverables/ milestones helps to manage risks and issues.</td>
</tr>
<tr>
<td>6.</td>
<td>Project Management Models/ frameworks</td>
<td>The research decomposed the Industrial System development into number of phases. Defined the organisation process with results and deliverables i.e. documents or system components which are to be</td>
<td>The research proposed that a bigger system can be managed effectively and efficiently by converting it into smaller phases of planning, analysis, functional and technical design, build, test (unit, assembly, UAT, performance etc.), implementation and maintenance. Furthermore each phase can have transitions to effectively move from one</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>

<td>---</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>7.</td>
<td>This research used object based models for better co-ordination of complex projects.</td>
<td>The object based model provided value addition by increasing the stability of the projects, co-ordination between PM tools and structure approach, and hence reducing uncertainty.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Models used on chip design, identifying problems/ issues with PM tools.</td>
<td>Model used properties of inheritance from one phase to next, modularity to break project into small pieces of work, using relation to define interactivity. Data hiding is used to provide information/ access to the authorised people.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Object based models were created to overcome the above issues and summarise the stages/ phases of the project in better way for the project manager.</td>
<td>The paper proposed that project managers should tailor the standard project management processes as per their requirements so as to enhance the efficiency and synergy among project activities and resources.</td>
<td></td>
</tr>
<tr>
<td>8.</td>
<td>This research highlighted that standard project management methodologies should be used by project managers.</td>
<td>The tailoring could be in terms of deliverables, documents, tools, methods, etc. to be used depending upon the complexity of the project.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Project manager should create his/her own set of required documents, deliverables, processes etc. for more efficient approach and better synergy among various project activities and resources.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following papers [9-12] have tried to implement the system modellung, estimation and object oriented concepts for better project management.

9. | This research paper proposed a methodology to integrate the use of system dynamics approach to manage risks within the existing project management processes. | Paper suggested the use of System dynamic modelling and framework within PMBOK processes for better management and control of risks in projects. |
|   | Project risks change dynamically as the projects are being run and are difficult to predict and manage. this paper suggested the use of system dynamic modelling and framework for better monitoring and control within the PMBOK risk management processes. | Dynamic modelling provides better control of risks and project managers will be able to forecast and manage project milestones more effectively. |

10. | This research suggested the use of system modelling as communication tool for evaluating and gathering stakeholder expectations in a better and efficient manner. | The research showed that System modelling could bridge the communication gap between clients and project managers. |
|   | Since communication levels and skills are different for project managers and business stakeholders, and hence there is a gap among customer expectations. This results in scope changes, time and budget changes, and quality. | PMs would be able to define models to define communications channels, means, processes, and manage the objectives, requirements, and expectations effectively and efficiently. |
|   | System modeling was used at MIT-Portugal Green Islands project. The results show that the communication gap can be bridged and stakeholders’ expectations would be satisfied more effectively. | The research shows that model would be able to provide framework to reduce communication gap and understand stakeholder expectation, which resulted in better scope, time and budget control. |

11. | This paper proposed the use of object oriented model for project management. | Project activities are represented in text and graphical form. |
|   | The hierarchical structure is used to represent the full development life cycle of the software project and provide a view of various parts to the project manager. | Paper demonstrated the used of various object oriented properties like inheritance, relations, modular, and data encapsulation for sharing information through different phases of the life cycle of the project. |
|   | The interactivity among various components of the projects is defined as relations among objects. | Various objects could be reused in different projects for better control. |

12. | This paper proposed an estimation model for determining the project effort based on use-case. Relationship between actual and estimated data is developed to be used for better estimates in future. | The research suggested an estimation model based on actual and estimated data to predict better results in future. |
|   | The model works better in iterative environments as it allows comparing of successive developments. | A mathematical model is created between actual and estimated data for more accurate forecasting. |
|   | The research on software and IT projects had been discussed in the research papers [13-22]. Authors had explored not only the standard project management methodologies like PMBOK, Prince2, RUP but also the new practices of Agile, JAD, RAD, extreme programming. Researchers had also suggested adaptations of project management models for managing complex projects in the software and IT industry. | This model is more suitable for iterative development environment. |

13. | This research paper discussed how the traditional process models in software engineering are being modified/ replaced with new web based models/ agile development due to more dynamic nature of projects and fast changing requirements. | The research paper discusses how the traditional processes have given way to new web based, iterative, and incremental models which can cater to the new demands and requirements in the fast and quick changing world. The changes are expected in terms of look and feel, market demand, technological advances, and providing more efficient services. |

<tbody>
<tr>
<td>14.</td>
<td>This paper suggested that customisation and tailoring of regular project management methodologies is required to increase efficiency of processes in large scale complex software projects. The research provides guidelines and techniques for developing generic models for process improvement. The customised model would be more productive and having better analysing capabilities as project manager would be able to focus on the necessary requirements only.</td>
<td>This research emphasised that regular project management methods/processes must be customised/tailored in order to make it more efficient and avoid unnecessary details. The research found that customised models are better, more efficient and effective due to better alignment with current scenarios and objectives. This also provides project manager with better analytical skills to focus on the necessary details.</td>
</tr>
<tr>
<td>15.</td>
<td>This research suggested a simple and straightforward Project Matrix model for technical project management of software projects. The model requires no special training or resources.</td>
<td>The model is found to be efficient and highly effective in coordinating resources monitoring and controlling software projects. The paper demonstrated that model would be able to produce high quality software projects with ease.</td>
</tr>
<tr>
<td>16.</td>
<td>This paper proposed the integration of RUP and PMBOK for managing technical software development process of product lifecycle and management of project lifecycle respectively for efficient and effective management of projects and delivering high quality products.</td>
<td>The paper suggested that organisation would be able to automate various activities/tasks in software development processes and project management with the integration of RUP and PMBOK methodologies. Using the capabilities of both RUP and PMBOK project manager would be able to manage projects more efficiently. This would in turn lead to better quality products.</td>
</tr>
<tr>
<td>17.</td>
<td>This research paper proposed the integration of standard software engineering practices with standard PM methodologies and framework to create a new framework for software development projects.</td>
<td>The results showed that new integrated framework would help to develop quality software project with better efficiency. Paper used standard software engineering framework from Spiral model, Waterfall model to create new framework integrated with PM methodology. This provided better planning, monitor and control, and execution of projects.</td>
</tr>
<tr>
<td>18.</td>
<td>This research paper proposed to make optimum utilisation of triple constraints of Time, Cost, and Scope as functions of project’s high-level requirements/business objectives. The new framework proposed extending the benefits of polarity management to triple constraints of PMBOK. Polarity management involves moving from focusing on one pole as the problem and the other as the solution (either/or thinking), to valuing both poles (both/and thinking). Good polarity management gets the best of both poles while avoiding the limits of either.</td>
<td>This paper suggested that integration of new framework which uses triple constraints as functions of business requirements/objectives for optimum utilisation. It also suggested that polarity management could be used to manage the triple constraints of PMBOK more effectively and efficiently, since these constraints of time, cost, scope are opposite of each other.</td>
</tr>
<tr>
<td>19.</td>
<td>Government IT projects were analysed critically by this research. Authors tried to identify various challenges/issues faced by e-government projects. The paper discussed the gaps in implementation of e-government projects, their monitoring and control as well as execution.</td>
<td>This research studied e-government projects and challenges faced by these projects. The study proposed that appraisal should be more systematic and periodic for successful completion. The appraisals have to be done in timely manner, risks and issues highlighted and thus controlling the projects efficiently.</td>
</tr>
<tr>
<td>20.</td>
<td>This research suggested the use of T-cube and Metromap visual tools for managing software development projects. These techniques use graphical and metaphor presentations to show various project management tasks. As the name suggests these techniques use Rubik Cube and Metro map metaphors.</td>
<td>The research proposed two techniques i.e. T-cube based on Rubik Cube and Metromap and tested them on real project data and found that these tools are effective and provide positive results for project management. The method provides graphical presentation which is easy to view/track monitor the milestones and deliverables. This results in better project management with improved visibility.</td>
</tr>
<tr>
<td>21.</td>
<td>This paper suggested the application of software agent framework to help in managing various processes of software projects. Two comprehensive frameworks were developed to assist all the core and facilitating processes and functions of software project management.</td>
<td>The paper demonstrated that the use of software agent framework could significantly help in meeting market expectations and deliver projects as per the stakeholders’ expectations adhering to schedule and budget. The framework assigns each agent to manage a small and manageable task, hence reducing complexity. The smaller tasks/activities are easier to manage and thus providing better monitoring and control of project.</td>
</tr>
<tr>
<td>22.</td>
<td>This research discussed whether the existing project management methodologies like PRINCE2 had been useful in the management of software projects and information systems. Organisations have to develop full scale quality management</td>
<td>The study suggested that the project managers may have to use some other tools for effort and budget estimation like function point, empirical etc. and performance measurement techniques along with standard project management methodology. The research showed that organisations may have to use CMMI, or other</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>---</td>

<td></td>
</tr>
<tr>
<td>plan to ensure delivering a good quality software product efficiently and effectively.</td>
<td>quality management plans to manage the projects in a better controlled manner.</td>
<td></td>
</tr>
<tr>
<td>Differences between managing projects in R&amp;D organisations and other projects had been examined in papers [23-24]. Since R&amp;D projects are knowledge intensive, hence gives rise to different set of requirements and expectations form stakeholders.</td>
<td>This approach suggested implementation of good project management practices and processes with consultation of teams from the early stages and improving them with tailor made training modules as and when required using just-in-time approach.</td>
<td></td>
</tr>
<tr>
<td>This research discussed an approach that emphasises on building relationship between project management and engineering processes for better management and improved performance of research projects and programmes. This had been used at systems management office at NASA Langley Research Centre.</td>
<td>This methodology also takes care of improvements in processes and policies. The approach also emphasised on conducting reviews and assessments independently for value addition.</td>
<td></td>
</tr>
<tr>
<td>This research paper discussed and analysed the differences among R&amp;D enterprises and other organisations. R&amp;D enterprises being knowledge intensive, therefore more emphasis has to be on knowledge management. Therefore a culture of sharing knowledge by use of documentations, templates, and shared information systems has to be created.</td>
<td>The sharing of knowledge through shared workspace, intranet sites, documents, research papers, discussion and chat groups along with blogs would provide easier sharing of information and knowledge in the organisation.</td>
<td></td>
</tr>
<tr>
<td>A number of empirical and statistical studies [25-33] had been conducted to investigate the success of various project management methodologies and frameworks. Data has been collected and analysed using various techniques in order to understand the effectiveness of diverse project management methodologies.</td>
<td>The survey found that people are using different tools and techniques for similar kind of projects as per their skills, comfort level, and experience. The tools are also sometimes prescribed by the organisation, limited by legacy systems and availability.</td>
<td></td>
</tr>
<tr>
<td>This research conducted a survey to find the experiences of people in project management. Survey finding were highlighted in terms of various methods, tools, techniques used and their effectiveness. Performance, project success factors and common criteria for managing successful projects were also studied.</td>
<td>Some PMs have also tailored the standard methodologies to suit their needs. This provides them to model the system as per their needs and requirements and hence reduce the cost.</td>
<td></td>
</tr>
<tr>
<td>This research studied various factors that influence the execution of project management and measure the performance of project management methodologies.</td>
<td>The study found that the 6 factors which have greater impact on execution of project management are Management commitment, financial constraints, organisational structure, reward system, education and training of project teams.</td>
<td></td>
</tr>
<tr>
<td>This research explained the importance of scope management for successfully managing ICT projects. Standish group’s CHAOS report states that only 1/3 of ICT projects are successful. Therefore project managers need to manage scope and changes more efficiently and effectively. This paper describes various approaches and techniques used by the trained scope managers in USA, Europe and Australia which have increased the success rate of the ICT project.</td>
<td>This paper suggested that with proper scope management process in place and with good training of PMs on scope and change management, ICT projects can be completed more successfully.</td>
<td></td>
</tr>
<tr>
<td>This research conducted an empirical study to identify the important factors in the success of software process management in software projects. The study was to find out the importance and prioritisation of other factors like baselining, user involvement, management commitment, change management and documentation etc. for successful completion of projects.</td>
<td>Paper highlighted the use of standard methodologies like PMI, Prince-2, and other PPM tools have helped the project managers to a great extent in managing the scope and deliverables. It also showed that different methodologies are popular in different countries.</td>
<td></td>
</tr>
<tr>
<td>This study tried to understand the effect of change on the methods, practices, and performance of ICT projects. The paper discussed the impact and challenges due to the dynamic nature of work and environment in the current scenario. The research focussed on finding the reasons for failure, and reviewed the tools, techniques, practices, standards. The also tried to analyse if these failure are due to changing, dynamic or unstable nature of ICT projects and environment.</td>
<td>Study found out that synchronisation/ synergy of activities/ tasks/ processes is more important than other processes for the successful management of software projects. The study also found out that other factors for process management in order of ranking were baselining, user involvement, management commitment, change management, and documentation.</td>

</table>
Various maturity models have been developed in the area of project management [67-76]. Maturity models help in assessing the capability and maturity of various processes, tools, techniques and management methodologies in an organisation.

67. This research studied the maturity levels of project management in different industries. They surveyed 126 organisations based on 42 components of maturity.

The investigation also studied various industries and formed it into four groups i.e. professional, scientific, technical services; information; financial and insurance; and manufacturing.

The research found that maturity level is 2 out of 5 w.r.t. 36 components out of 42 analysed.

The results showed that the maturity level of the four groups i.e. professional, scientific, technical services; information; financial and insurance; and manufacturing are similar across industries barring a few exceptions.

68. The use of maturity models in improving project management practice is discussed in this research paper. The paper analyses the current maturity models for project management.

The analysis showed that the maturity models are mostly used reactively rather than proactively. The study also emphasised the fact that more empirical evidence and research is required to establish relationship of project performance with project management maturity models.

The organisations that are using maturity models like CMMI are found to be in greater control of the projects since there processes are mature, well documented and provide good planning.

69. This research paper presented a Project Management Process Maturity (PM²) model to evaluate and compare project management levels of organisations.

PM² model provides a well-structured model for evaluating project management maturity level of organisations. The model takes into account PM processes, factors and characteristics and shows the organisation’s progress from functional to project driven organisation.

The model helps organisations to enhance their project management approaches, create better documentation and plans.

70. This research paper proposed a maturity model which has the maturity levels with continuous improvement group of Key Process Areas (KPAs). The paper has taken ISO 9001:2000 as base for quality management. Each KPA is mapped onto plan-do-check-act (PDCA) cycle. Conical structure is developed for displaying the gradual development of KPAs in a better manner. KPAs are developed till they attain a dependable maturity level for project management. These KPAs may have to be improved continuously in order to respond to the changes.

By defining KPAs and then improving those continuously using PDCA cycle would enable the organisations to manage the projects more effectively and efficiently. By clear mapping of the KPAs to PDCA cycle, organisation would be able to improve the management and delivery of projects continuously. Thus organisations can work to optimise the processes for effective and efficient delivery of the projects.

72. PMI, USA provided a very useful maturity model for organisations OPM3 to reflect their maturity with the best practices achieved within the project, portfolio, and programme domains.

OPM3 tries to link organisational strategy to successful, consistent, and predictable project completion. OPM3 divides the process improvement into four sequential stages i.e. Standardise, Measure, Control and continuously Improve.

73. IEEE developed a standard for Software Project Management Plans (SPMP), IEEE std. 1058-1998. This applies to all types of software projects and all sizes.

This IEEE standard specifies format and contents of SPMP but does not specify technique to be used or examples. This standard provides information and document for managing a software project.

The standard defines the technical and managerial processes necessary to deliver the project requirements.

74-76 Capability Maturity Model Integration (CMMI) provides a framework for process improvements across the enterprises. The models have been used in many organisations since 1995 when the models were first created.

This framework gives applications of principles, practices, and objectives to achieve enterprise-wide process improvement. Many organisations have been able to manage budget and times efficiently with enhanced productivity and quality of projects using CMMI.

Use of CMMI helps organisation to grow from Level1: Initial, Level2: Managed, Level3: Defined, Level 4: Quantitatively Managed to Level 5: Optimising.

CMMI provides two representations: continuous and staged. The continuous representation allows the organisation to focus on the specific processes that are considered important for the organisation’s immediate business objectives, or those to which the organization assigns a high degree of risks.

The staged representation provides a standard sequence of improvements, and gives a basis for comparing the maturity of different projects and organisations. The staged representation also provides for an easy migration from the SW-CMM to CMMI.
VII. SUMMARY

Project management is a very complex field and encompasses technical skills along with man management skills to manage stakeholder expectations. Projects are influenced by both internal and external factors and require various communication channels and techniques to reduce the gap and deliver project effectively and efficiently.

The studies have been conducted to understand the existing standard models [4-8] and adapt them so as to manage projects in a better way. Modifications have been suggested so as to make existing methodologies work in different areas of work. The studies showed that different methodologies could be suitable for different types of projects. It has also been proposed that tailoring of methodologies would be more useful for different scenarios providing efficient and effective project management and control. The studies also showed that large complex system can would be better managed and controlled by dividing the system into smaller modules or phases.

System modelling, dynamic modelling, estimation models and object oriented modelling concepts have been investigated for improving the project management [9-12]. The studies showed that system modelling would be useful to have better communication among different stakeholders by managing various communication means, channels and modes. The studies showed that risks could be forecasted and managed more effectively by the use of dynamic modelling. The studies also showed that object oriented modelling concepts and properties like inheritance, modularity, data-encapsulation, relations could be used to describe the life cycle of the projects and manage it more efficiently. The studies proposed a mathematical model for estimating and forecasting along with the use of iterative development for better monitoring and control of the project.

Software and ICT projects have their own challenges due to rapid technological advances, providing better services, facilities etc. Therefore standard project management methodologies only may not be sufficient for managing project in this area. These methodologies may have to enhance and that’s the reason that Agile, JAD, RAD, extreme programming have been developed [13-22]. The studies also showed that project management methodologies/ models should be customised/ tailored for the different projects so as to best fit the scenario and hence avoid unnecessary details and reduce cost and time. The studies also tried to combine different methodologies and framework like RUP, PMBOK, agent framework, metaphors and graphical presentations for creating new frameworks/ models to suit the requirements for managing, controlling, and execution of the project successfully within time and budget. The studies demonstrated that better estimates could be achieved and also stakeholders could manage in a better manner for overall success of the project. The studies also showed that quality control tools/ methodologies like ISO, CMMI would be highly useful in delivering good quality projects.

Stakeholders have different set of obligations, constraints, necessities, and expectations as projects in R&D organisations are knowledge intensive requiring more sharing of ideas. These differences have been highlighted in the research papers [23-24]. The studies showed that knowledge sharing areas/ sites for the researchers to share/ propose/ discuss their ideas by using blogs, discussion groups, and chat rooms would be highly useful to enhance creativity and innovations.

Researchers had been able to study various project management methodologies, tools, and techniques etc. empirically and statistically [25-33]. The studies showed that various factors like Management commitment, financial constraints, organisational structure, reward system, education and training of project teams play a crucial role in the successful management of projects. The project managers also tailor their methodology to suit the needs to reduce the cost and time for delivering the projects. The studies also proposed that scope and change management training would be highly useful to project managers for executing, monitoring, and controlling the projects successfully. The studies also showed that in new dynamic environment newer technologies would be more useful than traditional models of development and management of projects. Various techniques like critical path method, PERT, baselining, scope, change, and risk management would be of great help for successful delivery and management of the projects.

They had collected data from various projects to study different areas of project management and analysed it for understanding the effectiveness of various models, techniques or tools. Use of alternative statistical techniques and models such as Fuzzy Logic, NPV, approach-avoidance theory, had been explored in the project management area [33-38]. The studies showed that techniques like NPV, fuzzy logic would be highly useful in estimating and forecasting the project execution with better monitoring and control of the projects. The studies also showed that decision tree analysis, fishbone or cause-effect diagrams could be used effectively to manage quality, risks and deliver successful projects. Project managers need different skills/ tools/ techniques / methodologies to manage various projects efficiently.

Leadership abilities, communication and management abilities along with IQ, EQ, and MQ of the project manager have a huge impact on the projects [39-42]. Teaching of project management is not only about just teaching of GANTT and PERT chart but also must include various software and other tools for successfully managing projects. The studies have shown that project managers should use various communication tools/ methods with different stakeholders. Project managers should have the qualities to be a good team player, manager, having the ability to take decisions with responsibility to deliver successful projects. The studies showed that project manager should be able to manage the expectation of team members, motivating them, understand their training needs and communicate them at different levels so to manage various stakeholders, teams in a better manner and make them more productive.

Distributed environment of projects in the present multinational organisations gives rise to more complexities in all areas of project management [43-66]. Therefore standard project management methodologies have to be enhanced to meet diverse requirements from various stakeholders. The...
studies showed that distributed work environment has its own challenges and advantages. The challenges could be such as managing different time zones, cultural differences, virtual communication environments and costs associated with them, and many more. The advantages could be in terms of providing good quality projects at lower cost. This requires proper documentation, setup the correct expectations, managing various stakeholders and also managing the cross cultural issues effectively and efficiently. The conflict resolution criterion and transparent communication is the key to success in global scenarios and managing successful projects.

Maturity level is able to give the reliability of organisation in a particular area [67-76]. There are a number of maturity and capability levels for project management such as (PM)^3, OPM3, CMMI, IEEE, etc. against which an organisation can be appraised. The maturity models take into account PM processes, factors and characteristics and shows the organisation’s progress from functional to project driven organisation. The maturity models describe how mature the processes are, the success rate of the organisation in past, and also the probability that it would be able to deliver good quality projects. The organisation could use these models to build robust processes and also optimise them with feedback and changing scenarios and environment.
