Investigative Behavioral Intention to Knowledge Acceptance and Motivation in Cloud Computing Applications
Case study: Group of students from Jordanian universities

Sundus A. Hamoodi
Department of Business Networking and Systems Management
Philadelphia University
Amman – Jordan

Abstract—Recently the number of Cloud Computing users in educational institutions has increased. Students have the chance to access various applications and this gives the opportunity to take advantage of those applications. This study examined the behavioral Intention toward Cloud Computing Applications and evaluated the acceptance of these Applications. Participants population consisted of 110 students from different Jordanian universities. The results showed that Performance Expectancy, Effort Expectancy, Attitude toward using Technology, Social Influence, Self-Efficacy, Attention and Relevance have different levels of correlation with Behavioral Intention in Cloud Computing Applications, and there was no correlation between Anxiety and Behavioral Intention in Cloud Computing Applications.

Keywords—Cloud computing; formatting; ARCS model; UTAUT model

I. INTRODUCTION

Cloud Computing is considered as the most modern technique which can be used in education today in order to deliver services that can help students and learners to accomplish their tasks in an effective and efficient way.

Many researchers defined and described cloud computing in different ways. The researchers shared a number of facts about Cloud Computing that convert Information Technology from product to service. A number of researches clarified that "The cloud can provide exactly the same technologies as "traditional" IT infrastructure, the main difference, as mentioned previously, is that each of these technologies is provided as a service" [7]. Yuvaraj gave an example of Cloud Computing tools that may help users in different categories, "There are various cloud based tools for reference service needs of the libraries such as cloud-based video services (e.g. YouTube, TeacherTub), information collection services (e.g Google forms) and files sharing services (e.g. Dropbox)" [23].

Cloud Computing transfers the processing and storage to the cloud that saves more cost by providing more storage space, software license, and hardware device maintenance. Many features can be offered by Cloud Computing applications such as availability of the storage space that can be reached at any time at any place. According to Al Mourad and Hussain, "Cloud services deliver compute, storage, software, applications, etc. Via Internet to customers on a self-serve basic" [4]. In addition, students and learners can accomplish their works and assignments through cloud computing applications that enable them to share their duties with professors and students if required. Researchers in Cloud Computing discuss many challenges related to this technique. The most important of these challenges are lack of privacy and security [16] [17].

Other researchers also explain the Cloud Computing concept and how companies and universities move toward Cloud Computing [1] [3] [10]. However, few of them studied some of the factors which influence university students who use Cloud Computing applications in their study including homework assignment.

From previous studies, the researcher has identified several factors which may have influence on university students in using cloud Computer Applications.

The main objective of this paper is to examine the influence of these factors on students’ performance and seeks to answer to the following questions:

- Can Jordanian students work with Cloud Computing Applications?
- Do Cloud Computing Applications motivate students to use them in their study?
- What are the main problems facing Jordanian students in using Cloud Computing Applications?

The researcher has also defined a set of hypothesis, developed a questionnaire, and formed an experimental group of students to work on Cloud Computing Applications. The findings from using SPSS analysis were discussed and interpreted the correlations between different factors and behavioral intention to use Cloud Computing Applications.

II. PREVIOUS STUDIES

Cloud Computing is one of the modern terminology which has recently received an increasing attention by researchers in both theory and applications.
It was defined in several ways through its features and services that can be offered. According to U.S. National Institute of Standards and Technology (NIST), "Cloud computing is a model for enabling convenient on-demand network access to a shared pool of configurable computing resources (e.g., Networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction" [11]. Hashemi and Seyyed explained that "Cloud computing is making the pool of virtual computing resources with a focus on large scale computing resources that are connected to the network and which allows customers to be shared dynamic hardware, software resources and data, and according to their actual usage, paying costs" [9].

Based on the literature studies, the researcher defines Cloud Computing as follows: Cloud Computing is a model of services that allowed users to access and use different virtual resources in an easy way and without the need to recognize how to maintain and manage those resources.

The characteristics of Cloud Computing are discussed below:

A. On-demand access

On-demand network access is sharing a pool of computing resources by different users from different places. Users can access shared resources at any time and anywhere [3] [2] [12]. Karim discussed that "a wide range of end users have access to the applications and data served by the cloud" [10]. Cloud Computing resources grow on demand which led to that various applications uses cloud technology now a day [18]. Further, its being illustrated that "Using this feature when needed the customer can easily and automatically access computing facilities like server, net, storage from any provider as soon as possible." [8]. Access to Cloud Computing may take different ways depending on the user needs.

According to the National Institute of Standards and Technology’s (NIST), there are three ways to access a Cloud Computing: software as a service, platform as a service, and infrastructure as a service [15]. The demand on Cloud Computing increases due to the increased accessibility of the internet and its expansion using the digital devices [6].

In addition, other researchers discussed that using service models (Infrastructure, Platform and Software) are more flexible for education [1]. They encouraged to use Cloud Computing in education due to its features and the benefits it may result in such as; reduce cost of technology, enhance communications and give better service delivery. According to Adeoye, 2015 "Cloud computing is the better ICT utilization mechanism for educational institutions teaching, learning and a service delivery requirement, for it enables wise and strategic use of technology that significantly reduces the cost"[2].

B. Ubiquitous network access

Location-independent resource pooling: The resources needed by different customers can be supplied by providers which contain storage and memory frequency Internet and virtual systems as a pool feature [8].

C. Data storage

Storing information and data through Cloud Computing does not require large storage spaces on the user’s laptop and smart devices. "Cloud Storage delivers virtualized storage on demand over a network based on a request for a given quality of service (QoS)" [19]. On demand storage could be delivered by cloud storage on a network that based on a given quality service. Further, Abu El-Ala stated that Cloud Computing "includes all the services related to the infrastructure of the cloud such as physical resources (as storage devices, school servers, and national communication network, etc.)" [2].

Users can reduce their costs by using the Cloud Computing which does not require an internal power to store information [19].

D. Development and Maintenance

One of the Cloud’s benefits is that people and institutions are not responsible for updating and maintaining the applications and services. This means that they can save time and money for updating and maintenance needs. "User is not responsible for where the services or applications are located or how it maintained or updated") [3].

III. UTAUT MODEL

Unified Theory of Acceptance and Use of Technology Model (UTAUT) is a model of acceptance, formulated by Venkatesh and others, integrates theories and models to measure user’s intention and usage of technology [21]. The dimensions of this model as discussed by different authors [20], [5] are as follows:

- Performance Expectancy: mark the individual expectancy on how much a system will help in improving job performance.
- Effort Expectancy: Less effort and ease of use of the technologies.
- Social Factors: How others believe about using technology.
- Facilitating conditions: Infrastructure required for supporting technologies to facilitate tasks.
Different dimensions of the model were used in measuring motivation towards acceptance of those applications.

VI. RESEARCH MODEL

The research model showed in figure 2 measures the acceptance of Cloud Computing Applications and adapted from the work by [21] [12] [23].

This model discusses the effect of the certain factors which are (Performance Expectancy, Effort Expectancy, Attitude toward Using Technology, Social Influence, Self-Efficacy, Attention, Relevance and Anxiety) on the Behavioral Intention of Cloud Computing Applications. The purpose of this model is to examine the impact of the considered factors related to acceptance and motivation on Behavioral Intention to use Cloud Computing Application by university students.

VII. RESEARCH HYPOTHESIS

H0. There is no correlation between Performance Expectancy and Behavioral Intention in Cloud Computing Applications

H1. There is no correlation between Effort Expectancy and Behavioral Intention in Cloud Computing Applications

H2. There is no correlation between Attitude toward Using Technology and Behavioral Intention in Cloud Computing Applications
H3. There is no correlation between Social Influence and Behavioral Intention in Cloud Computing Applications

H4. There is no correlation between Self-Efficacy and Behavioral Intention in Cloud Computing Applications

H5. There is no correlation between Anxiety and Behavioral Intention in Cloud Computing Applications

H6. There is no correlation between Attention and Behavioral Intention in Cloud Computing Applications

H7. There is no correlation between Relevance and Behavioral Intention in Cloud Computing Applications

VIII. METHODOLOGY

A. Data Collection

The researcher collected data using the developed survey. The student participated in this study are 110. They are undergraduate and postgraduate students from different Jordanian universities. This study measures technology acceptance by adopting questions from [21][12][23].

B. Procedure

The study uses a mix approach of questionnaire and interview as follows:

- Investigating the dimensions of both the acceptance and motivation models.
- Distributing the questionnaire online to participant.
- Interviewing students to measure their acceptance and satisfaction.
- Analyzing the data using SPSS package.

Different Cloud Computing Applications are examined by this study.

C. Experimental Group

The goals of this experiment are to demonstrate the importance of cloud computing in student’s homework assignments and to examine the factors affecting students’ performance through observation and survey results.

For this purpose, a group of students has created and the analysis of an electronic survey using Form in Google Docs applications has been conducted.

At the first instance some of the students were reluctant to use the Cloud Computing Applications because they were lacking of expertise. With the efforts of the researcher in highlighting the advantages and the benefits of using Cloud Computing Applications and providing some training using Google Docs Applications, the group of the participants was highly motivated to use this technology.

Thus, the participant group has conducted their assignment in an efficient way and achieved better results compared with their colleagues who have not used Cloud Computing Technology.

The experimental group got benefits from using Google Docs Application as follows:

- Creating large number of surveys for free
- Sharing knowledge, ideas and thoughts with large number of participants through a web browser.
- Distributing the surveys globally via URL or an e-mail.
- Collecting responses automatically in MS Excel for easy analysis, charts and functions.
- Helping students in choosing different question types through Google Form.

IX. RESULTS AND DISCUSSIONS

A. Descriptive Sample

The sample of the study consisted of 110 undergraduate and postgraduate students. The findings show that 64.5% of the respondents are of age 18 to 24, 26.4% of the respondents is of age 25 to 31, 5.5% of the respondents are of age from 31 to 37 and 3.6% of the respondents are of age 45 or greater. These results are illustrated in figure 3.

![Fig. 3. Distribution of the participants’ age](image)

The results in figure 4 show those participants with computer experience which ranging from excellent (27.3%) to week (1.8) based on Likert scale.
The results show that the experimental group has

Fig. 4. Distribution of participants’ computer experience

B. Statistic

The findings from the data analysis show the following:

H0. There is a significant relation between Performance Expectancy and Behavioral Intention in Cloud Computing Applications (equal = 0.594 significant at level 0.01).

H1. There is a significant relation between Effort Expectancy and Behavioral Intention in Cloud Computing Applications (equal = 0.455 significant at level 0.01).

H2. There is a significant relation between Attitude toward Using Technology and Behavioral Intention in Cloud Computing Applications (equal = 0.589 significant at level 0.01).

H3. There is a significant relation between Social Influence and Behavioral Intention in Cloud Computing Applications (equal = 0.504 significant at level 0.01).

H4. There is a significant relation between Self-Efficacy and Behavioral Intention in Cloud Computing Applications (equal = 0.478 significant at level 0.01).

H5. There is a negative relation between Anxiety and Behavioral Intention in Cloud Computing Applications (equal = -0.121 significant at level 0.01).

H6. There is a significant relation between Attention and Behavioral Intention in Cloud Computing Applications (equal = 0.642 significant at level 0.01).

H7. There is a significant relation between Relevance and Behavioral Intention in Cloud Computing Applications (equal = 0.556 significant at level 0.01).

The results show that the students are able to use Cloud Computing Applications with different levels of knowledge through the questionnaire and observations. It also show that there is a significant relation between Performance Expectancy and Behavioral Intention in Cloud Computing Applications (equal = 0.594). However, it has been found that there is a weak correlation (equal to 0.454) between usefulness and Behavioral Intention of Clouds Computing regarding to the Performance Expectancy.

In addition, the results also show Performance Expectancy, Effort Expectancy, Attitude toward Using Technology, Social Influence, Self-Efficacy, Attention and Relevance have different levels of significant correlation with Behavioral Intention in Cloud Computing Applications with a negative correlation between Anxiety and Behavioral Intention in Cloud Computing Applications. This negative correlation may be due to the students’ hesitation of using Cloud Computing Applications. Their anxiety might be caused by the fear of losing information as a result of choosing a wrong option.

Further, the results show that the experimental group has the desire to use Cloud Computing Applications. However, the survey results also show that they have some anxieties toward using Cloud Computing Applications as a result of lack of sufficient knowledge on the benefits of the cloud technology.

The results indicating that there is a motivation toward using a Cloud Computing Applications among students as explained by the significant relation between Attention and Behavioral Intention in Cloud Computing Applications.

One of the benefits of the experimental group in this study is highlighting the need for considering more factors that may have impacts on Behavioral Intention in Cloud Computing Applications. Such factors are those that may affect the use of a Cloud Computing Application in free time, planning to use it in future, and using this technology as often as possible.

X. CONCLUSIONS

This study finds out that Jordanian university students have the desire, motivation and ability to use Cloud Computing Applications in conducting their study work including homework assignment. However, instructors have to work toward encouraging and educating students on the importance of Cloud Computing Applications and their roles in getting the required information and facilitate the mechanics of completing homework. This would alleviate anxiety due to lack of sufficient knowledge on the benefits of Cloud Computing Applications.

It also concluded that students using Cloud Computing Applications are performing better than those who have not used this technology. The analysis of the results indicates that there is a positive correlation between almost all the considered factors in this study and Behavioral Intention in Cloud Computing Applications.

XI. FUTURE WORK

This study should be explored to include more students from different countries to have comprehensive results. The study may be expanded by further consideration of the relation between knowledge acceptance and other factors.

Based on the results of this study it is proposed to establish a virtual Cloud Acceptance and Usability Center (CAUC). The purpose of set center is to contains all the research outputs in the different areas of Cloud Computing from different countries to enhance cloud products, make it more usable, and
obtain comprehensive results and comparative studies among users of Cloud Computing Applications globally.
